Amendments to the Claims

A complete list of all claims under examination is set out below. Please amend claims 1, 6, 7, 27, and 30 as shown below in marked form:

1. (Currently Amended) A conductive film comprising a flexible support, an extensible metal or metal alloy layer, and a crosslinked polymeric protective layer, wherein the metal or metal alloy layer is formed by deposition, and the film has at least one permanently deformed curved region.
2. (Original) A film according to claim 1, wherein the metal or metal alloy layer is substantially continuous, and the at least one permanently deformed curved region is compound curved.
3. (Original) A film according to claim 2, wherein the film is light transmissive.
4. (Previously Presented) A film according to claim 1, wherein the metal or metal alloy layer comprises silver and the crosslinked polymeric layer comprises an acrylate polymer.
5. (Previously Presented) A film according to claim 1, comprising two or more metal or metal alloy layers.
6. (Currently Amended) A film according to claim 5, wherein the metal or metal alloy layers are separated by a crosslinked polymeric spacing layer and provide an infrared-rejecting Fabry-Perot stack.
7. (Currently Amended) A film according to claim 1, wherein an interface between the metal or metal alloy layer and an adjacent layer within the film has been subjected to an adhesion-enhancing treatment, or wherein one or more adjacent layers within the film comprise an adhesion-enhancing ~~adjuvant~~ additive, whereby the corrosion resistance of the film is increased.

USSN: 10/521,827

Docket No.: 58046US012

8. (Previously Presented) A film according to claim 1, having a length and an electromagnetic shielding capability that is retained when the film is strained in a tensile mode by 5% of its length.
9. (Previously Presented) A film according to claim 1, having a length and an electromagnetic shielding capability that is retained when the film is strained in a tensile mode by 10% of its length.
10. (Previously Presented) A film according to claim 1, having an electromagnetic shielding capability that is retained when the film is bent at a 45° angle.
11. (Previously Presented) A film according to claim 1, that exhibits color-shifting behavior when viewed from different viewing angles.
12. (Previously Presented) A film according to claim 1, further comprising at least one planar region.
13. (Previously Presented) A film according to claim 1, further comprising a thermoplastic supplemental support.
14. (Previously Presented) An electrical device comprising the film of claim 1.
15. (Original) The device of claim 14, wherein the device is selected from the group consisting of a cell phone, a personal digital assistant, a computer, and combinations thereof.
16. (Original) The device of claim 14, wherein the device comprises a heater.
17. (Withdrawn) A method for forming an article comprising:
- a) providing a preform comprising a thermoplastic support having a metal or metal alloy layer and a crosslinked polymeric protective layer;
  - b) molding, embossing, thermoforming or otherwise deforming the preform to provide a self-supporting article having at least one permanently deformed curved region.

USSN: 10/521,827  
Group Art Unit: 1775  
Docket No.: 58046US012

18. (Withdrawn) A method according to claim 17, wherein the metal or metal alloy layer is substantially continuous, and the at least one permanently deformed curved region is compound curved.
19. (Withdrawn) A method according to claim 18, wherein the metal or metal alloy layer and the crosslinked polymeric protective layer are light transmissive.
20. (Withdrawn) A method according to claim 17, wherein the metal or metal alloy layer comprises silver and the crosslinked polymeric layer comprises an acrylate polymer.
21. (Withdrawn) A method according to claim 17, wherein the preform comprises two or more metal or metal alloy layers.
22. (Withdrawn) A method according to claim 17, wherein the deforming is carried out by vacuum molding.
23. (Withdrawn) A method according to claim 17, wherein the deforming is carried out by thermoforming.
24. (Withdrawn) A method according to claim 17, therein the deforming is carried out by embossing.
25. (Withdrawn) A method according to claim 17, wherein the formed article has a length and an electromagnetic shielding capability that is retained when the article is strained in a tensile mode by 5% of its length.
26. (Withdrawn) A method according to claim 17, wherein the formed article has an electromagnetic shielding capability that is retained when the article is bent at a 45° angle.
27. (Withdrawn and Currently Amended) A method according to claim 17, wherein the ~~perform~~ preform has a first surface resistivity, wherein the deforming strains the article in a tensile mode

USSN: 10/521,827  
Group Art Unit: 1775  
Docket No.: 58046US012

by at least 5% of its length, and wherein the formed article has a second surface resistivity that is not substantially degraded relative to the first surface conductivity.

28. (Withdrawn) A method according to claim 27, wherein the second surface resistivity is no more than two times the first surface resistivity.

29. (Withdrawn) A method according to claim 27, wherein the second surface resistivity is less than the first surface resistivity.

30. (Withdrawn and Currently Amended) A method according to claim 19, wherein ~~perform~~ the preform has a first amount of haze, wherein the deforming strains the article in a tensile mode by at least 5% of its length, and wherein the formed article has a second amount of haze that is not substantially degraded relative to the first amount of haze.

31. (Withdrawn) A method according to claim 30, wherein the first and second amounts of haze are both below 5%, 3%, or 2%.
